## HOMEWORK 5

Due date: Tuesday of Week 6,

Exercises: 2.3, 6.1, 6.2, page 437-439

Here is a translation of Ex 6.1. Let  $f_1, f_2, f_3, \ldots, \in \mathbb{C}[x_1, \ldots, x_n]$  be an infinite sequence of polynomials. Let  $V = \{a = (a_1, \ldots, a_n) \in \mathbb{C}^n : f_i(a) = 0, \forall i \geq 1\}$ . Show that there exists a finite number of polynomials  $g_1, \ldots, g_k \in \mathbb{C}[x_1, \ldots, x_n]$  such that  $V = \{a = (a_1, \ldots, a_n) \in \mathbb{C}^n : g_i(a) = 0, 1 \leq i \leq k\}$ .

**Problem 1.** Suppose that the following diagram of R-modules is commutative and the rows are exact sequences

$$\begin{array}{cccc}
M & \xrightarrow{\phi} & N & \xrightarrow{\psi} & P & \longrightarrow 0 \\
\downarrow^f & & \downarrow^g & & \downarrow_h \\
0 & \longrightarrow M' & \xrightarrow{\phi'} & N' & \xrightarrow{\psi'} & P'
\end{array}$$

Show that there is an exact sequence

$$0 \to \operatorname{Ker}(\phi) \to \operatorname{Ker}(f) \to \operatorname{Ker}(g) \to \operatorname{Ker}(h) \to \operatorname{Coker}(f) \to \operatorname{Coker}(g) \to \operatorname{Coker}(h) \to \operatorname{Coker}(\psi') \to 0.$$

The homomorphism  $\partial: \operatorname{Ker}(h) \to \operatorname{Coker}(f)$  is defined as

$$\partial(x) = (\phi')^{-1} g \psi^{-1}(x), \forall x \in \text{Ker}(h).$$

You are required to check that  $\partial$  is well-defined and check the sequence is exact at every place. The above assertion is called the extended snake lemma.

**Problem 2.** Use the above extended snake lemma to give a new proof of the following 3-lemma. Given the following commutative diagram of R-modules with exact rows

$$0 \longrightarrow M \longrightarrow \phi \longrightarrow N \longrightarrow \psi \longrightarrow P \longrightarrow 0$$

$$\downarrow^f \qquad \downarrow^g \qquad \downarrow^h \qquad \downarrow^h \qquad 0 \longrightarrow M' \longrightarrow N' \longrightarrow P' \longrightarrow 0$$

If two of f, g, h are isomorphisms, then the third one must be an isomorphism.

Think about if it is possible to use the above 3 lemma to give a new proof of the 5-lemma.

## Problem 3. Let

$$(0.1) M' \xrightarrow{u} M \xrightarrow{v} M'' \longrightarrow 0$$

be a sequence of R-modules. Let N be another R-module. We can form the following sequence

$$(0.2) 0 \longrightarrow \operatorname{Hom}(M'', N) \xrightarrow{v^*} \operatorname{Hom}(M, N) \xrightarrow{u^*} \operatorname{Hom}(M', N)$$

where  $u^*(f) = f \circ u$  for  $f \in \text{Hom}(M, N)$  and  $v^*$  is defined similarly. Show that the sequence (0.1) is exact iff the sequence (0.2) is exact for any R-module N.

## Problem 4. Let

$$0 \longrightarrow N' \xrightarrow{u} N \xrightarrow{v} N''$$

be a sequence of R-modules. Let M be another R-module. We can form the following sequence

$$(0.4) 0 \longrightarrow \operatorname{Hom}(M, N') \xrightarrow{u_*} \operatorname{Hom}(M, N) \xrightarrow{v_*} \operatorname{Hom}(M, N'')$$

where  $u_*(f) = u \circ f$  for  $f \in \text{Hom}(M, N')$  and  $v_*$  is defined similarly. Show that the sequence (0.3) is exact iff the sequence (0.4) is exact for any R-module M.

1

2 HOMEWORK 5

An R-module M is called Noetherian if its submodules satisfies acc conditions. Recall that this is equivalent to that every submodule of M is finitely generated. We learned in class that a finitely generated module over a Noetherian ring is a Noetherian module.

**Problem 5.** Given a short exact sequence of R-modules

$$0 \to N \to M \to P \to 0$$
.

Show that M is Noetherian iff both N and P are Noetherian.

Caution: A subring of a Noetherian ring is not necessarily a Noetherian ring. Example, let  $R = F[x_1, x_2, \ldots]$  be a polynomial ring with infinite number of variables over a field F. You can check that R is an integral domain but not Noetherian. Let K be the fractional field of R. Then K is a Noetherian ring but R is not.

**Problem 6.** Let R be a module and M be a Noetherian R-module. Let  $f \in \operatorname{Hom}_R(M, M)$ . Show that if f is surjective then it is also injective and thus an isomorphism. Give an example of  $f \in \operatorname{Hom}_{\mathbb{Z}}(\mathbb{Z}, \mathbb{Z})$  (here  $\mathbb{Z}$  is viewed as an  $\mathbb{Z}$ -module and thus f is just a homomorphism between abelian groups, which is not required to be a ring homomorphism) such that f is injective but it is not surjective.

Hint: consider the chain submodules  $\operatorname{Ker}(f) \subset \operatorname{Ker}(f^2) \subset \cdots \subset \operatorname{Ker}(f^n) \subset \cdots$ . Since M is Noetherian, it is stationary. Let  $N = \bigcup_{i=1}^{\infty} \operatorname{Ker}(f^i) = \operatorname{Ker}(f^n)$  for a big n. Consider the map  $g = f|_N : N \to N$ . Show that g is well-defined (namely g(N) is indeed in N) and surjective. Then consider  $g^n$ .

If M is Noetherian (which means any submodule of M is finitely generated), then it is finitely generated. The converse is false. Namely, if M is finitely generated, it is not necessarily Noetherian, unless the ring R is also Noetherian. For example, if  $R = F[x_1, x_2, \ldots]$ , the polynomial ring over a field F with infinitely many variables, and M = R. Then M is finitely generated (actually it is generated by  $1 \in R$ ), but M is not Noetherian, because its submodule (in this case, it is just an ideal)  $I = \langle x_1, x_2, \ldots, \rangle$  is not finitely generated.

The above problem is also true if M is finitely generated (without assuming it is Noetherian), which you can prove in the next HW. But it is false if M is not finitely generated, namely, if R is not finitely generated R-module, then  $f \in \operatorname{Hom}_R(M,M)$  surjective does not imply it is injective. Even when R is a field so every module is a vector space, surjectivity does not imply injectivity if the dimension is not finite. Here is one example. Consider  $M = \mathbb{Z} \times \mathbb{Z} \times \cdots = \prod_{i \geq 0} \mathbb{Z}$  (infinite copies of  $\mathbb{Z}$ , see also the next part of this HW for infinite product of modules) and consider the map

$$f: M \to M$$

$$(\alpha_0, \alpha_1, \alpha_2, \dots) \mapsto (\alpha_1, \alpha_2, \alpha_3, \dots).$$

Then f is surjective but  $\operatorname{Ker}(f) \cong \mathbb{Z}$ . On the other hand, the isomorphism  $M/\operatorname{Ker}(f) \cong \operatorname{Im}(f) = M$  does not directly imply  $\operatorname{Ker}(f) = 0$ . See the above example when  $M = \prod_{i \geq 0} \mathbb{Z}$ . Think about why (the reason is: equality and isomorphism are different. This is subtle but important).

## 1. Product and direct sum of modules

We have defined direct sum and direct product of vector spaces. The definition can be extended to modules over rings. We fix a ring R (which is assumed to be commutative with 1 as usual).

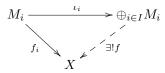

**Definition 1.** Let I be an index set. Suppose that we are given a module  $M_i$  over R for each  $i \in I$ . The **direct sum** of  $M_i$  is a pair  $(\bigoplus_{i \in I} M_i, (\iota_i)_{i \in I})$ , where

- (1)  $\bigoplus_{i \in I} M_i$  is a module over R; and
- (2)  $(\iota_i)_{i\in I}$  is a family of maps  $\iota_i \in \operatorname{Hom}_R(M_i, \oplus_{i\in I} M_i)$ ,

such that for any other R-module X, and for any other family of linear maps  $f_i \in \text{Hom}_R(M_i, X)$  for each  $i \in I$ , there is a unique homomorphism  $f : \bigoplus_{i \in I} M_i \to X$  such that  $f_i = f \circ \iota_i$  for each  $i \in I$ .

HOMEWORK 5 3

In other words, we have the following diagram

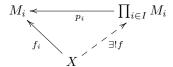

Dually, we can define direct products.

**Definition 2.** Let I be an index set. Suppose that we are given a module  $M_i$  over R for each  $i \in I$ . The **direct product** of  $M_i$  is a pair  $(\prod_{i \in I} W_i, (p_i)_i)$ , where

- (1)  $\prod_{i \in I} M_i$  is an R-module; and
- (2)  $p_i: \prod_{i\in I} M_i \to M_i$  is an R-module homomorphism,

satisfying the following universal property. Given any pair  $(X, (f_i)_{i \in I})$ , where X is a vector space and  $f_i \in \operatorname{Hom}_R(X, M_i)$ , then there is a unique linear map  $f: X \to \prod_{i \in I} M_i$  such that  $f_i = p \circ f$ .

**Theorem 1.1.** Direct product and direct sum exists.

*Proof.* Define  $\prod_{i \in I} M_i$  as follows. As a set, it is just the product whose elements are  $(\alpha_i)_{i \in I}$ , with each  $\alpha_i \in M_i$ ; the addition and scaler product are defined component wise:

$$(\alpha_i)_{i \in I} + (\beta_i)_{i \in I} := (\alpha_i + \beta_i)_{i \in I}, \alpha_i, \beta_i \in M_i;$$
  
$$r(\alpha_i)_{i \in I} := (r\alpha_i)_{i \in I}, r \in R.$$

Define  $p_i: \prod_{i\in I} M_i \to M_i$  be the projection:  $p_i((\alpha_i)_{i\in I}) = \alpha_i$ .

Define  $\bigoplus_{i \in I} M_i = \{(\alpha_i)_{i \in I} \in \prod_{i \in I} M_i | \alpha_i = 0 \text{ except for a finite number of } i \in I \}$  and define  $\iota_i : M_i \to \bigoplus_{i \in I} M_i$  by  $\iota_i(\alpha) = (\alpha_i)_{i \in I}$ , where  $\alpha_i = \alpha$  and  $\alpha_j = 0$  if  $j \neq i$ .

**Problem 7.** Show that  $(\prod_{i\in I} M_i, (p_i)_{i\in I})$  is indeed the direct product (namely, it satisfies the universal property in Definition 2) and  $(\bigoplus_{i\in I} M_i, (\iota_i)_{i\in I})$  satisfies the universal property in Definition 1. Thus the direct sum is the same with direct product only when the index set I is finite.

**Problem 8.** Let I be an index set. Suppose that we are given a module  $M_i$  over R for each  $i \in I$ . Let X be any R-module. Show that there are isomorphisms

$$\operatorname{Hom}_R(X, \prod_{i \in I} M_i) \cong \prod_{i \in I} \operatorname{Hom}_R(X, M_i);$$
  
$$\operatorname{Hom}_R(\bigoplus_{i \in I} M_i, X) \cong \prod_{i \in I} \operatorname{Hom}_R(M_i, X).$$

Keep in mind that  $\operatorname{Hom}_R(X, M_i)$  is also an R-module and  $\prod_{i \in I} \operatorname{Hom}_R(X, M_i)$  denotes product of R-modules.

Let M be an R-module. Recall that a subset  $S \subset M$  is called a basis of S if (1) S is linearly independent and (2) S generates M. An R-module M is called free if it has a basis. If |S| = n, we get an isomorphism  $R^n \cong M$ .

**Problem 9.** Let I be an index set and  $M_i$  is a free R-module for each i. Show that  $\bigoplus_{i \in I} M_i$  is also a free R-module.

In general, an infinite direct product of free modules is not free. For example,  $\prod_{i \in I} \mathbb{Z}$  is not a free abelian group if I is infinite, see this link.

**Problem 10.** Let R be a ring and N be any R-module. Show that there exists an isomorphism

$$\operatorname{Hom}_R(R^m, N) \cong N^m$$
.

for a positive integer m.

4 HOMEWORK 5

If R is a field. This is Theorem 3.1 of Hoffman-Kunze. For general R the proof is similar. It can also be deduced from Problem 8.
